

Select **Start APP** so the display will switch from the current program to a third-party Android application when triggered. You can follow the steps below to make this work:

Step 1: Install your Android application (e.g. VEVO) on your Android smart phone. You can download the application in Google Play Store.

Step 2: Install and run **Apk Extractor** on your phone. Extract your application's APK (e.g. VEVO) to your phone's storage. Note that the APK's name is *Vevo_com.vevo.apk*, which means its package name is *com.vevo*. You can download Apk Extractor in Google Play Store.

Step 3: Copy the APK to a USB flash drive and insert it to your player. Enter the player's **Android Interface > Desktop > ES File Explorer > udisk** to install VEVO on the player. Reboot the player when finished. See **Player Owner's Manual > Android Interface** for instruction.

Step 4: Select **Start APP** for the selected zone in the program's layout and then click **Advance**. Type the APK's package name *com.vevo* into the field of **APP Package**. Complete the other settings and click **OK**.

Step 5: Publish your campaign (which includes the program) to the player.
